Continuation of 3. Applicant's reply has overcome the following rejection(s): because claims 11 and 12 have been cancelled, the rejection of claims 11 and 12 under 35 U.S.C. 112, first paragraph is now moot.

Continuation of 5. does NOT place the application in condition for allowance.

Claims 11 and 12 have been cancelled thus rendering the rejection of claims 11 and 12 moot.

It is noted that claim 5 was cancelled in the communication filed 3/11/02 (as Paper No. 20). Therefore, Claims 1, 3, 4 and 34-37 are pending in the application (not claims 1, 3-5 and 34-37).

Claims 1, 3, 4, and 34-37 stand rejected under 35 U.S.C. 103(a) for the reasons set forth in a previous Office Action. Applicants request reconsideration of the rejection of claims 1, 3, 4, and 34-37 for the following reasons.

First Applicants note that the Examiner conceded that neither Wolozin or Yan indicate that an interaction between RAGE and PS2 existed. Applicants contend that absent the data provided in the applicants disclosure, it would not have been predictable that such an interaction would be useful for identifying neuroprotective therapeutics in a cell (see p.6-8 of Applicant's response). In response, it is noted that although neither Wolozin or Yan teach a direct interaction between RAGE and PS2, it was indicated in the previous Action that it would have been obvious to one of skill in the art that there is at least an indirect interaction between RAGE and PS2 via amyloid-beta, as evidenced by the fact tthat amyloid-beta increases apoptosis in cells expressing either RAGE or mutant PS2. Therefore, given the fact that 1) Yan teaches that amyloid-beta-RAGE interaction induces apoptosis which contributes to neurotoxicity and dementia by activating oxidant stress and cellular activation (cytokine production, chemotaxis and haptotaxis); and 2) Wolozin teaches that amyloid-beta increases apoptosis in cells expressing mutant PS2 (as well as wild-type PS2) which leads to apoptotic neuronal cell death; it would have been predictable that a method comprising adminstering amyloid-beta to a cell expressing both RAGE and a mutant presenilin-2 protein could be useful for identifying neuroprotective therapeutics as well as methods for identifying compounds which inhibit neurocytotoxicity as well as compounds which inhibit the cytotoxic effects of cytokines and oxidative stress on neuronal cells. Furthermore, even without the teaching of a direct interaction between RAGE and PS2, it would have been predictable that a cell expressing both RAGE and mutant PS2 were involved in neurodegeneration (as evidenced by Wolozin and Yan).

Second, Applicants contend that there is an unexpected interaction between RAGE and PS2 which results in a synergistic increase in apoptosis in cells expressing RAGE and PS2. In response, as mentioned in the previous Office Action, the Examiner respectfully disagrees with the applicants contention that there is a synergistic interaction between RAGE and PS2 which results in a dramatic increase in apoptosis for the following reasons: First, although the applicants contend a synergistic interaction between mutant PS2 and RAGE, no data in the specification support such a notion. The specification discloses apoptotic levels in amyloid-beta treated control cells (i.e. mock-transfected cells), cells that express RAGE and cells that express RAGE and mutant PS2 (see Figure 3 of the instant application). Figure 3 does not show a control wherein the treated cells express mutant PS2 but not RAGE. Without a comparison of cells expressing mutant PS2 alone versus cells expressing both mutant PS2 and RAGE, a synergistic interaction cannot be determined. Therefore, it cannot be determined if the cells expressing both mutant PS2 and RAGE show an increase in apoptosis compared to cells expressing mutant PS2 but not RAGE.

It is acknowledged that the specification discloses "while mutant presenilin-2 by itself has little effect on apoptosis, cells co-transfected to express mutant presenilin-2 and RAGE showed a dramatic increase in apoptosis..." However, Wolozin appears to contradict this statement. Specifically, Wolozin teaches, "cells transfected with vector (CTRL) or wild type human PS2 (PS2wt) show low levels of apoptosis, whereas cells transfected with N141I mutant human PS2 (PS2mut) in which Asn is mutated at position 141 [the same mutant PS2 used by the Applicants], show elevated levels of apoptosis and more cell detachment (see legend for Figure 1C, p. 1710). It is also clear in Figure 1D of Wolozin that aproximately 60% of cells expressing mutant PS2 show apoptosis, which appears to contradict the assertation that mutant PS2 itself has little effect on apoptosis.

Considering the lack of a working example clearly indicating a syngerstic interaction between RAGE and mutant PS2 and further considering the fact that the prior art indicates that mutant PS2 can have a dramatic effect on increasing apoptosis by itself (rather than a "little effect on apoptosis" as asserted in the specification), it cannot be concluded that there is synergistic interaction bewtween RAGE and mutant PS2. Without evidence of an unexpected result (for instance, by Declaration), the rejection of claims 1, 3, 4 and 34-37 over Wolozin in view of Yan stands.
